Jiao Gong(001561450) Program Structures & Algorithms Fall2021

Assignment No.1

Task

This assignment will begin to build your algorithmic skills. It will also give you some experience with random number generation in Java.

An important example of a practical experiment is called the "random walk" experiment.

Imagine a drunken man who, starting out leaning against a lamp post in the middle of an open space, takes a series of steps of the same length: 1 meter. The direction of these steps is randomly chosen from North, South, East or West. **After n steps, how far (d), generally speaking, is the man from the lamp post?** Note that *d* is the Euclidean distance of the man from the lamp-post.

It turns out that there is a relationship between *d* and *n* which is typically applicable to many different types of stochastic (randomized) experiments. Your task is to implement the code for the experiment and, most importantly, to **deduce the relationship**.

Please clone/pull from the class repository and work on *RandomWalk.java* and *RandomWalkTest.java* each of package *randomwalk* and each under the appropriate source directory. [You may have to remove other java files from the classpath in order to allow the whole project to compile. In IntelliJ/IDEA you can do this for entire packages by right-clicking and choosing "Mark Directory As... Excluded"]. Once you have all the unit tests running, you can do the experiment by running *RandomWalk* as a main program (provide the value of *n* as the first argument).

For this particular assignment, it is **necessary but** *not* **sufficient** to ensure that the unit tests all run. You must demonstrate via image files, graphs, whatever, what experiments you made in order to come up with the required expression. You will run the experiment for at least six values of *n* and will run each of these at least ten times. That's to say, you will run the program *at least* 60 separate times. Feel free to change the main program so that it will run all your experiments in one shot instead of 60 different runs.

Your submission should include:

- 1. Your **conclusion** about the relationship between *d* and *n*;
- 2. Your **evidence** to support that relationship (screen shot and/or graph and/or spreadsheet);
- 3. Your **code** (*RandomWalk.java* plus anything else that you changed or created);
- 4. A **screen shot** of the unit tests all passing.

Please note: for this assignment, you do not need to set up github and push your files, as described in the general instructions for submission (Submitting Assignments). Note also that common sense should tell you how d varies with I. Don't spend a lot of time agonizing over this aspect of the assignment. What we are primarily interested in is how d varies with n.

Relationship

 $d=\sqrt{n}$, the distance is equal to the square root of steps the drunk takes.

Evidence

Csv data

Write the experimental results into csv, and draw a graph to show the relationship between distance and steps.

(graph 4. Experiments result chart)

From the graph 4, we could see that there is a positive correlationship between the distance and steps, and the line chart in the coordinate are similar the log function. So I guess the relationship between them is the logarithm function. And I add another column data.

	Table 1			distance	— Log2
steps	distance	Log2	40.0000000000000000		
10	2.641520243939510	3.32192809488736	+0.000000000000000

40	5.335740692515340	5.32192809488736			
50	6.790453296744300	5.64385618977472			W WA1 .44
60	7.173253269976880	5.90689059560852		. 40	"M.M.
70	7.457145154335150	6.12928301694497	20.00000000000000000	·M	
80	7.692659509688900	6.32192809488736		W 11.	
90	8.959996948315310	6.49185309632967			
100	8.162874423459710	6.64385618977473	10.0000000000000000000	N	
110	9.323694147768840	6.78135971352466			
120	10.10637629579270	6.90689059560852	0.0000000000000000000000000000000000000		
130	10.95983030995610	7.02236781302845		80 150 220 290 360 430 500	 570 640 710 780 850 920 990
140	10.31346089879180	7.12928301694497			

(graph 5. Experiments result chart with Ign)

In the graph 5, we can see that the log function fits the experimental data very well at the beginning, but as the number of steps increases, the difference between the results becomes larger and larger, so this guess is not true.

Is there any other function image shape that matches the experiential result? Maybe be square root function can be.

(graph 6. Experiments result chart with Ign and sqrt)

As can be seen from the graph 6, the experiments result and sqrt function are roughly coincident.

Conclusion

So, we guess:

$$d=\sqrt{n}$$
